### EPIDEMIOLOGY

#### SOURCE OF EVENT OR ORIGIN OF INFECTION

- Contact with wild species

#### EPIDEMIOLOGICAL COMMENTS

This is the first detection of avian influenza H5N1 in an unusual host in the national territory (marine mammal); sea lion *Otaria flavescens* is the affected species. Regarding organization, the National Directorate of the National Fisheries and Aquaculture Service (SERNAPESCA) carries out the risk assessment and defines the actions to be implemented in each zone; Regional Directorates are responsible for implementing these measures. To date, the agent has not been detected in other marine mammals. Following the first detection of the pathogen, and based on the location where the affected animal got stranded, a disease control zone was defined along the coastline, where notification of stranded animals is reinforced with sectoral users and clinical and molecular surveillance is implemented in animals with signs and symptoms consistent with highly pathogenic avian influenza, aimed at the early detection and timely control of the spread of the virus. In geographic areas that are not within this zone, passive surveillance will be maintained, focusing on the follow-up of reports.
